OBJECTIVE

Motivated Computer Science student with hands-on experience building full-stack applications, real-time systems, RAG pipelines, and containerized infrastructure. Seeking a software engineering internship to contribute to production-grade projects, deepen backend and AI expertise, and grow within a collaborative engineering team.

EDUCATION

Bhagwan Parshuram Institute of Technology, Delhi
in Computer Science | CGPA: 9.5 / 10

2024 – 2028 *B.Tech*

TECHNICAL SKILLS

Languages: C++, JavaScript, TypeScript, Python, SQL, HTML, CSS

Frameworks & Technologies: Node.js, React 19, Next.js, FastAPI, Express.js, MongoDB, Supabase, Socket.io, REST APIs

AI & RAG: OpenAI API (GPT-4o), Gemini, Claude, Pinecone (vector DB), RAG pipelines

CS Fundamentals: DSA, DBMS, System Design (Microservices, Load Balancing, Caching)

PROJECTS

Herizon - MERN Stack, Socket.io, TailwindCSS, JWT

- Built a real-time crisis intervention platform with sub-100ms WebSocket latency, enabling live communication between users and mentors during high-stress situations.
- Implemented Role-Based Access Control (RBAC) with JWT authentication to enforce secure, tiered access across user and mentor roles.
- Engineered a Zero-Friction Bridge protocol allowing mentors to push live video call links directly into user interfaces, bypassing email/SMS delays critical during emergencies.

Connect the Dots - React, Node.js, Express, MongoDB, MinIO, Nginx, Docker

- Architected a fully containerized full-stack system with Nginx as reverse proxy, integrating a React frontend, Express REST APIs, MongoDB metadata store, and MinIO object storage into a single reproducible deployment.
- Designed file upload, metadata CRUD, and retrieval workflows following a proxy-first architecture pattern for scalability and service isolation.
- Wrote Docker Compose configuration enabling one-command environment setup across development and production environments.

RepoChat - RAG-based GitHub Repository Analyser - Next.js, FastAPI, Python, Pinecone, GPT-4o / Gemini

- Built an end-to-end RAG pipeline that clones any GitHub repository, parses source files using AST-aware chunking, embeds via user-supplied API key, and stores vectors in a Pinecone index with per-repo namespace isolation.
- Supports multi-agent selection - users bring their own API key and choose their preferred LLM (GPT-4o, Gemini, retrieval engine fetches top-k chunks via cosine similarity and synthesises answers with exact file path and line number citations.
- Engineered async FastAPI background job processing with live polling endpoint; Next.js dashboard visualises realtime progress (clone → chunk → embed) before auto-redirecting to the chat interface.

ACHIEVEMENTS & ACTIVITIES

- Pre-Finalist, Industrial Ideathon 2025 - selected in top 30 out of 600+ competing teams.
- Finalist, Vibe with Singularity Hackathon - selected among top teams in a competitive full-stack/AI hackathon.
- 3rd Place, DTU Reverse Engineering Contest - demonstrated strong low-level systems and debugging skills.
- Solved 250+ DSA problems on LeetCode and GeeksforGeeks (handle: vaibhav050910), focusing on graphs, linked lists and trees.
- GirlScript Summer of Code 2026 (GSSoC '26) contributor merged 5+ pull requests across open-source projects, demonstrating consistent collaborative development in a competitive national program.
